

File Name: wk11d02ex01_compute_average.py

Short Description: A beginner-friendly average calculator that calculates the average of user-inputted numbers using functions, loops, conditional statements, and input validation.

Author: Pascua, Gaea Nikolaev B.

Date: 2026-09-27

```
def toFixed(value, digits):
    return "%. *f" % (digits, value)

def computeAverage(arr, count):
    accum = 0
    sentence = "The average of "
    for coun in range(0, count - 1 + 1, 1):
        print("Input the value of the " + str(coun + 1) + ending(coun + 1) + " number.")
        arr[coun] = float(input())
        accum = accum + arr[coun]
    if count == 2:
        if coun == 0:
            sentence = sentence + str(arr[coun]) + " "
        else:
            sentence = sentence + "and " + str(arr[coun])
    else:
        if coun == count - 1:
            sentence = sentence + "and " + str(arr[coun]) + ""
        else:
            sentence = sentence + str(arr[coun]) + ", "
    sentence = "Great job! " + sentence + " is " + toFixed(accum / count, 2) + "."
    print(sentence)

def ending(number):
    if number > 10 and number < 20 or number % 100 > 10 and number % 100 < 20:
        end = "th"
    else:
        if number % 10 == 1:
            end = "st"
        else:
            if number % 10 == 2:
                end = "nd"
            else:
                if number % 10 == 3:
                    end = "rd"
                else:
                    end = "th"

    return end

# Main
print("Hello, dear user! I am Flowy, your friendly Mathematics teacher! Today, we'll calculate the average of the numbers you input. Oh before that, what's your name?")
name = input()
print("Wonderful name! Let's start! How many numbers do you need the program to average?")
print("Just a reminder, " + name + "! The average will be rounded up to 2 decimal points.")
number = int(input())
while number < 1:
    print("Oh no, the number you inputted is invalid! Please type in a positive real number.")
    number = int(input())
numbers = [0] * (number)

computeAverage(numbers, number)
```
